

Executive Summary

Fork repository: <https://github.com/razonm/munch>

The scottysab/rootbeer repository is heavily worked on, on a consistent basis. Since the start of the project, there have been over 200 updates to 36 source files across eighteen developers. The most active developers are Scott Alexander-Bown and Matthew Rollings. Scott Alexander-Bown also made several of the most recent changes while grubeli made the most recent change. Many developers only have one commit which may indicate they could be removed from this team. It is important to note this data and the following graphs are derived from a search on executable source files. Therefore, developer contributions on other files, such as graphical assets, are not reflected and should be considered in employee evaluations.

There have not been any commits in over a year indicating the project has reached a stable point. Developers can likely be relieved from this specific responsibility and redirected onto cultivating new projects for the company. Moreover, we should ensure we retain the most active developers for future maintenance. Developers show comfortability in Kotlin and Java as that is the language of most source files. Recruitment should aim to attract proficiency in these to expedite the onboarding process of new members.

Data for the report is collected from scripts using the GitHub API and was compiled using Matplotlib.
